

**IN THE CLAIMS:**

1           1.       (Original) An arc tube having a glass tube that is wound into a spiral, wherein  
2                   the glass tube has an inner shape of a substantially circular cross section, with  
3           an inner tube diameter in a range of 5 mm to 9 mm inclusive, and  
4                   a bulb wall loading is set so that a temperature of a coldest spot within the  
5           glass tube under steady state illumination falls into a range of 60° C to 65° C inclusive.

1           2.       (Original) An arc tube having a glass tube that is wound into a spiral, wherein  
2                   the glass tube has an inner shape of a substantially elliptical cross section, with  
3           an inner tube major axis in a range of 5 mm to 9 mm inclusive and an inner tube minor axis  
4           of 3 mm or larger,  
5                   a bulb wall loading is set so that a temperature of a coldest spot within the  
6           glass tube under steady state illumination falls into a range of 60 °C to 65 °C inclusive.

1           3.       (Original) The arc tube of Claim 1, wherein  
2                   the bulb wall loading is set within a range of 0.08 W/cm<sup>2</sup> to 0.12 W/cm<sup>2</sup>  
3           inclusive.

1           4.       (Original) The arc tube of Claim 1, wherein  
2                   the glass tube is in a shape of double-spiral comprising a turning part, a first  
3           spiral part, and a second spiral part, the turning part being located in substantially a  
4           midsection of the glass tube, the first spiral part starting from one end of the glass tube and  
5           spiraling around a pivotal axis to reach the turning part, the second spiral part starting from  
6           the turning part and spiraling around the pivotal axis to the other end of the glass tube.

1           5.     (Original) The arc tube of Claim 3, wherein  
2                   the glass tube is in a shape of a double-spiral comprising a turning part, a first  
3     spiral part, and a second spiral part, the turning part being located in substantially a  
4     midsection of the glass tube, the first spiral part starting from one end of the glass tube and  
5     spiraling around a pivotal axis to reach the turning part, the second spiral part starting from  
6     the turning part and spiraling around the pivotal axis to the other end of the glass tube.

1           6.     (Currently Amended) The arc tube as recited in one of ~~Claims 1 to 5~~ Claim 5,  
2     wherein  
3                   the glass tube is formed so as to fit into a cylindrical space of maximum  
4     diameter in a range of 30 mm to 40 mm inclusive and maximum length in a range of 50 mm  
5     to 100 mm inclusive.

1           7.     (Cancelled)

1           8.     (New) The arc tube as recited in Claim 1, wherein elemental mercury is  
2     sealed within the glass tube.

1           9.     (New) The arc tube as recited in Claim 2, wherein elemental mercury is  
2     sealed within the glass tube.

1           10.    (New) The arc tube as recited in Claim 3, wherein elemental mercury is  
2     sealed within the glass tube.

1           11.    (New) The arc tube as recited in Claim 4, wherein elemental mercury is  
2     sealed within the glass tube.

1           12.   (New) The arc tube as recited in Claim 5, wherein elemental mercury is  
2   sealed within the glass tube.

1           13.   (New) A low-pressure mercury lamp that includes the arc tube as recited in  
2   Claim 1.

1           14.   (New) A low-pressure mercury lamp that includes the arc tube as recited in  
2   Claim 2.

1           15.   (New) A low-pressure mercury lamp that includes the arc tube as recited in  
2   Claim 3.

1           16.   (New) A low-pressure mercury lamp that includes the arc tube as recited in  
2   Claim 4.

1           17.   (New) A low-pressure mercury lamp that includes the arc tube as recited in  
2   Claim 5.

1           18.   (New) A low-pressure mercury lamp that includes the arc tube as recited in  
2   Claim 6.

1           19.   (New) In a low-pressure mercury lamp, the improvement of a glass tube  
2 comprising:

3                   the glass tube configured to have a shape of double-spiral comprising a turning  
4 part, a first spiral part, and a second spiral part, the turning part being located in substantially  
5 a midsection of the glass tube, the first spiral part starting from one end of the glass tube and  
6 spiraling around a pivotal axis to reach the turning part, the second spiral part starting from  
7 the turning part and spiraling around the pivotal axis to the other end of the glass tube; and

8                   a bulb wall loading is set within a range of  $0.08 \text{ W/cm}^2$  to  $0.12 \text{ W/cm}^2$   
9 inclusive, so that a temperature of a coldest spot within the glass tube under steady state  
10 illumination falls into a range of  $60^\circ\text{C}$  to  $65^\circ\text{C}$  inclusive.
